Clearstone 1/2" to 1 1/2"

Clearstone 1/2" to 1 1/2" is a material manufactured by crushing larger rock to reduce it in size to 1/2" to 1 1/2". Its primary use is for around foundation walls and footings. This material should be placed under and over 4" perforated pipe, with the holes in the pipe facing downward. This material can also be used for drainage under concrete floors ensuring there is pipe in place and a drain off pipe, under swimming pools during installation when water appears prior to installation, in septic disposal fields, and any area where water causes a problem or needs to be relieved.
