## P Stone

At Howard Little Excavating, we carry two types of P Stone. One product comes from the screening of sand. The stone is screened off by using a screening operation and a series of screens that separate the fine from the medium and coarse materials. The product is 3/8" to 5/8" in size and is smooth like river stone, excellent for playground equipment.

The second product is manufactured the same way but comes from granite stone, which is a rougher stone to handle. This product is excellent for walkways, rock garden material because it locks together and lies on the ground. It is a very clean product that could be used for top dressing for driveway work, edging around home, under eaves of home to keep mud from staining concrete walls or wood siding.
