Pit Run Gravel

Pit run gravel is a material that is well draining and would be extracted from a bank with no manufacturing taking place. It is primarily used for a road base and driveways, or extremely soft areas. The material can range in size from 6" to 12". It is not recommended for home owner usage as it is extremely hard to level and usually requires machinery for leveling. For stability in soft areas and to cover larger rock, it should be put on in layers at least 1' in depth.
