Type I Gravel

Type I gravel is a material manufactured from pit run gravel. Pit Run Gravel is put through a crusher and reduced to maximum size of 20mm or $\frac{3}{4}$ ". Its primary use is for top dressing of roadways, parking areas and driveways. This material should be applied in 2" to 6" layers and tends to compact and drain very well. This material can be placed to fine grade with a dozer or grader due to its size. Type I can also be used for backfill around swimming pools for example.
