Type II Gravel

Type II gravel (80mm) is a well draining material manufactured from pit run gravel. Pit run gravel is put through the crusher and reduced to a maximum size of 80mm or 3 ¼". Its primary use is for a road base, soft spots in driveways, and farm roads. This material should be applied in 6" to 8" layers, compacts well, and is normally covered over with a Type I material.

Type II gravel can also be used for backfill around foundations because of its tendency to drain well.
